Notes on the user management

When updating the terminal to V1.2.0 the following must be considered regarding the user management:

- The *Access Level* setting is no longer available; it is replaced by the *(User) Type* setting. With the help of the User Type setting, a user's access rights can be set in much more detail.
- All existing users, except for the administrator, are converted to the *Standard* user type. This setting could be converted into an appropriate user type depending on the original intended use for the respective user.
